

SERVER MIGRATION PROJECT

A new client approached us with an interesting business issue. They had a legacy IT system running Novell GroupWise and Netware which has been unsupported for many years. They needed an IT partner that was not only able to work with this technology but have the necessary skills to migrate to a system that would enhance the business for many years.

There were problems with their Internet provider and they had no internal knowledge on how to resolve. They were in post-production for a children's program in CBBC and could not afford downtime so planning was important to their business.

Customer Background

Our customer is well-established video production company based in Buckinghamshire.

Solution

After the initial discussions we quickly identified a plan that was agreed by all parties. Having spoken to the broadband provider we were able to identify the issues and discuss a plan to migrate them to a new platform. We recommended a new Windows 2012 solution running virtual servers to maximise the investment. Due to the nature of the business downtime was going to be an issue.

We identified a weekend that we could all agree and made sure the internet provider was on-board with all the critical changes required. We completed the whole project and the business was up and running Monday morning without disruption.

Business Benefit

Yellowspring has proved to be the reliable and knowledgeable IT provider they had been looking for and consequently our client no longer has the worries concerning their IT system and can focus on their business and customers. The business now has a reliable up to date platform and that will help their business to grow in the future.
